## ENUBET (Enanced NeUtrino BEams from kaon Tagging)

- New-concept  $\nu_e$  source based on tagging of large angle  $e^+$  from  $K^+ \rightarrow e^+ \pi^0 \nu_e$  decays in an instrumented decay tunnel (98%  $\nu_e$  from  $K^+$  decays)
- Reduction of the systematic uncertainties on the knowledge of the initial neutrino flux to 0(1%) level

### Physics programme

- Unprecedented high precision measurement of  $\nu_e$  and  $\bar{\nu}_e$  cross sections
- Highly beneficial for tackling the main open neutrino-related issues: mass hierarchy,  $\theta_{23}$  octant, leptonic CP violation
- First step towards a time tagged neutrino beam: direct  $\nu$  production/detection correlation

## Ultra-Compact Calorimeter prototypes

### Shashlik with integrated readout

**Basic shashlik calorimeter:** Scintillator / absorber sampling calorimeter, read out by Wavelength Shifter (WLS) optical fibers, routed to PMT

**Ultra-Compact shashlik prototype:** basic iron/scintillator shashlik where each WLS fiber is read out by one single SiPM.

Electronic r/o in the bulk of detector: **compact structure**

Prototype tested @ CERN (PS-T9) → G. Ballerini et al. JINST 13 (2018) P01028

### Polysiloxane shashlik calorimeters

**First use in HEP.** Elastometric material with interesting properties

- **Superior radiation hardness** (transparent after 10 kGy dose exposure)
- **Easier fabrication** process: initial liquid form poured at 60°. No drilling of the scintillator.
- **Good optical contact with fibers**

### Prototype tested @ CERN (PS-T9)

- 12 UCMS: 3 (beam direction) x 2 x 2
- Active layer 3 times thicker: 15 mm compensate 30% lower light yield w.r.t. EJ200
- **Energy resolution:** 17% /  $\sqrt{E(\text{GeV})}$  comparable with plastic scintillator based prototype
- **Good linearity:** < 3% in the 1-5 GeV
- **Fiber-scintillator coupling** after pouring is comparable to that obtained from injection molding of conventional scintillators

### Lateral scintillation light readout

Light collected from scintillator sides and bundled to a single SiPM reading 10 fibers (5 scintillators)

SiPM are not immersed anymore in the hadronic shower thus less compact but ..

- Much **reduced neutron damage** (larger safety margins)
- **Better accessibility**
- **Safer WLS-SiPM coupling**

### Test of SiPM radiation-hardness

- Van de Graaf CN accelerator at Laboratori Nazionali di Legnaro p (5 MeV) +  $^{9}\text{Be}$  n + X (p currents < 1  $\mu\text{A}$ , n ~ 1-3 MeV)
- **Test beam @CERN (PS-T9)**
- **Loss of single p.e sensitivity** after  $3 \cdot 10^9 \text{ n/cm}^2$
- **Constant mip peak/e peak**

F. Acerbi et al. JINST 14 (2019) P02029

### Tagger prototype tested @ CERN (PS-T9)

- 84 UCM :
  - ✓ EJ204 plastic scintillator
  - ✓ Y11 & BCF92 WLS fibers
  - ✓ FBK 4x4 mm<sup>2</sup> SiPMs
- Measures repeated with different tilt angle (from 0 to 200 mrad)
- Uniformity, optical coupling to photo-sensors, e/π separation → **In progress**
- Comparison with Geant4 simulation of the detector → **In progress**
